4 December, 2015

Dear Skills Netherlands,

In response to your request for business cases in software development I would like to point out an internal project. This is an unfinished project in need of completion.

We specialise in low availability, high reliability applications used for outdoor electronics.
One of our customers has put in a request for a large project.
Currently we approach the project from two different angles: a team looks into the preparation of the hardware for software integration and we had a developer who looks into the preparation of a software demo that uses dummy data. However, our developer has suddenly left, leaving an important part of the work unfinished. Therefore I would like to make an enquiry about hiring one of your top-students to take care of some critical missing features.
We would need the software ready for testing by the end of March 2016, preferably sooner.

A little more information about the project:

-   The code is written in Microsoft C# .NET, Windows Forms
-   We estimate the project being about halfway completed
-   The interface is more or less done, though it needs to be extended
-   It involves industrial outdoor sprinkler systems, like those used in agriculture
-   Currently missing is an XML interface to store data
-   The application needs to be able to monitor and configure the sprinklers

Important to us is, that your candidate is able to assess the situation quickly.
The candidate may choose to completely rebuild the application from scratch or finish the code we will be sending. The only thing that's key to us is that the announced deadline is met and that the application works well enough for our presentation.
Could you please inform me as soon as possible about your decision in this matter?

Sincerely yours,

Dan Cromwell,
Human Resources Manager
